*Elevated concentrations of CA125 can be associated with endometriosis and fibroids and therefore their value in pre-menopausal women is limited. It is also associated with malignant tumors of the pancreas, breast, lung, colon and ovary. Approximately 80% of patients with advanced ovarian cancer and 50% of patients with stage I disease have elevated CA125 levels. Despite its poor sensitivity and specificity, CA125 is useful for detecting and monitoring tumors of the ovary.
