**Discussed suspected Cancer referral with patient, appointment within 2 weeks expected** ☐ Y ☐ N

**Symptoms/Reason for Suspicion:**

**Immediate referral** - Phone to paediatric registrar via switch board 01902 3079999

|                                                                                                                             |                          |
|-----------------------------------------------------------------------------------------------------------------------------|--------------------------|
| Unexplained petechiae, hepatosplenomegaly, extensive unexplained bruising or blood count/film suggestive of acute leukaemia | <input type="checkbox"/> |
|-----------------------------------------------------------------------------------------------------------------------------|--------------------------|

**Urgent referral - Patients to be seen within 48 Hours**

|                                                                                                                                                                                                     |                          |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| Unexplained lymphadenopathy or splenomegaly. (When considering referral, take into account any associated symptoms, particularly fever, night sweats, shortness of breath, pruritus or weight loss) | <input type="checkbox"/> |
| Unexplained lump that is increasing in size                                                                                                                                                         | <input type="checkbox"/> |
| Palpable abdominal mass or unexplained enlarged abdominal organ                                                                                                                                     | <input type="checkbox"/> |
| Unexplained visible haematuria                                                                                                                                                                      | <input type="checkbox"/> |
| Persistent bone pain or X-ray suggests the possibility of bone sarcoma                                                                                                                              | <input type="checkbox"/> |
| Ultrasound scan findings that are suggestive of soft tissue sarcoma, or if ultrasound findings are uncertain and clinical concern persists                                                          | <input type="checkbox"/> |

**Suspected brain tumour -Same day referral if high index of suspicion**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                          |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| Newly abnormal cerebellar or other central neurological function                                                                                                                                                                                                                                                                                                                                                                                | <input type="checkbox"/> |
| Headaches: New persistent (continuous for over 4 weeks) headache that wakes a child from sleep, occurs on waking, or at any time if child under 4 years. (When considering referral take into account confusion/disorientation, persistent nausea/vomiting or early morning vomiting, visual symptoms and signs, motor symptoms and signs, growth/puberty and development abnormalities, behavioral change, seizures, or altered consciousness) | <input type="checkbox"/> |
| High index of suspicion (Same day referral)                                                                                                                                                                                                                                                                                                                                                                                                     | <input type="checkbox"/> |
| Low index of suspicion but CNS tumour remains in differential (Patient to be seen within 2 weeks)                                                                                                                                                                                                                                                                                                                                               | <input type="checkbox"/> |

**Suspected retinoblastoma (Patients to be seen for ophthalmological assessment within 2 weeks)**

|                   |                          |
