Test(s) Required (please tick box to select)

Known Chest Condition (Review):
(Spirometry on patient's current inhaled medication)

☐

Skin Prick Allergy test:
(Common allergens only)

☐

New Diagnosis:
(Spirometry and bronchodilator response)

☐

FeNO Measurement:
(Fractional exhaled nitric oxide)

☐

Clinical Details

Reason for the test:

Medication:

See summary below

Smoker:

Years smoked:

Cigarettes / day:

Years quit:

Spirometry Contraindications

Haemoptysis, unstable cardiovascular status (PE, unstable angina), acute illness (nausea/diarrhoea), recent MI <4weeks, recent chest or abdominal surgery < 6weeks, recent eye surgery, recent pneumothorax, Aneurysm.

Spirometry - General Information

Note: A recent or current exacerbation/chest infection may impact on the accuracy of any baseline spirometry measurement, subsequently BD response testing would not be undertaken.

By selecting 'New Diagnosis' you are authorising the Lung Function team to administer 400mcgs salbutamol via a spacer as part of the test.

BD response criteria ATS/ERS >12% and 200ml increase in FEV1 and/or FVC. Spirometry testing will include interpretation reported by a Respiratory Physiologist. Airway obstruction will be classified using NICE COPD 2010 guidelines.

FeNO - General Information

Use measurement of FeNO to find evidence of eosinophilic inflammation. A positive test increases the probability of asthma but a negative test does not exclude asthma. FeNO testing will include interpretation reported by a Respiratory Physiologist. FeNO severity will be classified using current clinical guidelines.

Referrer
